

## CSS Positioning

### STATIC

The default positioning of HTML elements.

```
"I'm in my  
default  
position!"
```

### RELATIVE

Element is positioned relative to its normal position.

```
position: relative;  
right: 80px;  
top: 50px;
```

### FIXED

Element is positioned relative to the viewport and stays in the same place even if the page is scrolled. It's also removed from the document flow. So elements in the DOM pretend like it's not even there!

```
position: fixed;
```

```
"I'm another element & I don't  
care about the fixed element. I  
pretend it's not there."
```

### ABSOLUTE

Element is positioned relative to the nearest relatively positioned ancestor. If no ancestor with position of relative is found, the element positions against the document body.

```
position: relative
```

```
position: absolute;  
right: 0;  
bottom: 0;
```
